

# Bär Marinelift SliderParty

## System information

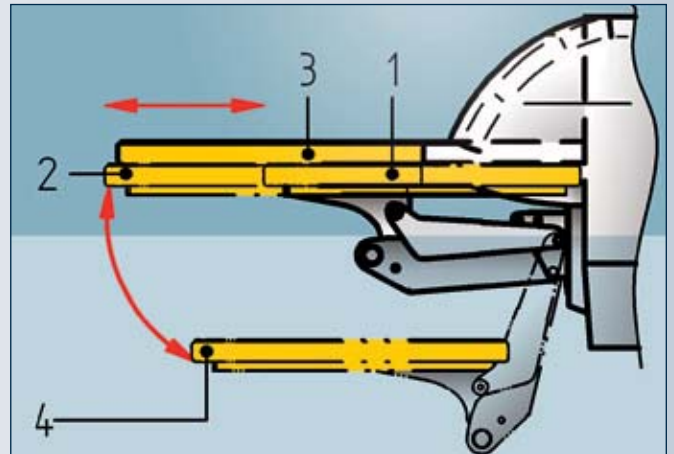

For yachts beginning with 37 ft/11m length with a huge deck surface behind the stern.

This is technically the most ambitious Marinelift as it extends your yacht in cruising and parking position just minimally – but if you would like to anchor and you need additional (party) space then it is ideal!

The extension result out of the extension of the platform (up to 1200 mm) and also of the docking to the fixed platform. This means both platform depths add up.

Even if you do not align the tender boat, you have more space than without the Marinelift!

Of course, the Marinelift can be used as a swimming or diving base when the platform is lowered.

In contrast to the Marinelift StandardPlus, the SliderParty platform disposes of its own hydraulic drive. Despite this, the control with its three functions is pretty easy:

- lowering into the water
- in party position
- in cruising position

This works in all positions – that means that the control executes automatically the necessary movements.

# Bär Marinelift SliderParty

With relatively small yachts the Marinelift SliderParty may not only lift and alight a huge and heavy tender, but also transport it vibration-free (view attributes Bär Marinelift).

Additionally you can enjoy the comfort of entering and leaving the anchored yacht with your tender boat passengers easily and drily!

The Marinelift SliderParty requires certain conditions on the boat rear. This may increase the retrofit price by necessary modifications.

In case of a retrofit, the boat weight will increase by the weight of the Marinelift and normally by the heavier tender (e.g. Jet). In the case of boats and yachts with a high charge on the stern, the additional weight can be compensated by floating bodies. The driving qualities of the yacht will not be affected.
