

Attributes Bär Marinelift

Adaptability

Bär Nautic Boarding offers a best adapted Marinelift for every yacht.

The Bär Marinelift is built modularly. Therefore the four Marinelift –sizes / load moment levels can be combined with the four Marinelift systems.

The design of the yacht stern determines to a large extent which Bär Marinelift system can be fitted:

- Standard – For yachts of all sizes with huge deck surface behind the stern. Predestined for double-z-drive. Especially the Marinelift BM 3-400S for smaller and midium size yachts up to 46ft/15m. In general it is also suitable for other drive configurations. Use of the BM 6-700S for midium size yachts.
- StandardPlus – For yachts of all sizes that have no or just small deck surface behind the stern. The Marinelift with the largest diving depth by horizontal operation of the platform. Thanks to the motion curve of the moving platform there is enough space for the aileron, balance assy, etc. Possible for all Marinelift sizes.
- SliderParty - For yachts beginning with 37 ft/11m with a huge deck surface behind the stern. For small and midium size yachts in combination with the BM 6-700 SLP.
- SliderBoat - For yachts beginning with 42ft/13m with or without boat garage, that have no or just small deck surface behind the stern. For midium size and huge yachts. Depending on the size of the tender boat the BM 6-700SLB as well as the BM 12-1200SLB are applicable.

Installation proposals are created for free, if 3-D-CAD-data in *.STEP or *.IGES format or substed 2D *.dxf are sent to use.
